

From First Use to Independent Performance

I transform fragmented technical expertise into clear learning, competency, assessment and content-control systems.

A public reconstruction of a complete technical-onboarding architecture for specialist software, designed to move a new user from first exposure to independently completing defined standard work.

EXECUTIVE SUMMARY

A complete public case study covering problem diagnosis, learner experience, observable competence, evidence-based assessment and controlled learning content.

BUSINESS PROBLEM

- Fragmented documents and trainer-dependent demonstrations.
- No shared learning pathway or observable competency standard.
- Readiness decisions based on variable evidence and informal judgment.

APPROACH

- 01 Diagnose the operational and learning problem.
- 02 Map the learner experience and support points.
- 03 Define observable competence and evidence.
- 04 Standardize assessment and readiness decisions.
- 05 Control learning content through metadata, ownership and versioning.

FIVE-DELIVERABLE TIMELINE

PORTFOLIO ARCHITECTURE

MY CONTRIBUTION

- Problem framing and system boundaries
- Learner and stakeholder analysis
- Competency and assessment architecture
- Learning-content governance and traceability
- Editorial information design and QA

SKILLS DEMONSTRATED

SYSTEM POSITIONING

Knowledge & Learning Systems Consultant — translating complex expertise and inefficient workflows into clear training, documentation, assessment and visual systems.

Design logic, evidence and fit

The portfolio is designed for fast review while preserving the system boundaries, evidence logic and traceability expected in technical work.

KEY DESIGN PRINCIPLES

01

Evidence before opinion

Readiness requires observable, recorded evidence.

02

Representative performance

Assessment reflects the standard work expected.

03

Integrated readiness

No single score, output or evidence type is sufficient.

04

Critical barriers stay visible

Judgment, quality and escalation cannot be averaged away.

05

Content supports preparation

Learning material does not prove competence.

06

One authoritative source

Versioned objects prevent conflicting active guidance.

BIGGEST CHALLENGES

Tacit expertise without disclosure

Reconstruct credible technical-learning logic without publishing confidential workflows or data.

Independence versus support

Define autonomy without discouraging justified escalation for genuine exceptions.

Consistency versus judgment

Standardize evidence and decisions without reducing technical readiness to a rigid checklist.

Learning Content Architecture

LESSONS LEARNED

- Start with system boundaries, not course modules.
- Separate learning, performance, evidence and readiness.
- Treat content governance as part of learning-system design.

SUITABLE PROJECT TYPES

- Specialist-software onboarding
- Technical role transitions
- Competency and readiness frameworks
- Knowledge-capture and content-governance systems
